Phone +57 316-531-0636

Multimedia Engineer with 5 years of experience specializing in frontend development. I have collaborated with cross-functional teams using tools such as **Angular, React.js, React Native, and Next.js** to build and maintain high-quality web solutions. I am an enthusiastic and collaborative developer, constantly learning new technologies and refining my development skills.

WORK EXPERIENCE

Frontend Developer

Febrero 2021 – Actualidad

Progracol, Bogotá, Colombia

Iris

I worked as a frontend engineer on Iris. Iris is a program for managing and controlling employees, including project contract approval, operator management, and administrative tasks. I gained experience in user interface design and code refactoring, all using Angular.

- Severe problems in the legacy project were corrected by updating and reducing dependency packages.
- Consuming APIs for data communication.
- Screen readability and keyboard navigation were improved through the use of semantic HTML.
- I implemented code best practices in the codebase that improve code readability and extensibility.
- Error handling issues that resulted in blank pages were resolved.
- The application's state management system was refactored, resulting in a reduction in code readability and standard text.

My Market

He worked as a Frontend Engineer at "My market". "My market" is a website for managing products and suppliers to control prices and supplies for different government entities. This project was started from scratch but divided into four parts: a library containing the styles and general components, and three other entities called administrator, suppliers, and clients, all using Angular.

- Creation of a general-purpose library for components and styles.
- Gained experience as a mentor, providing guidance and training to new developers.
- Creation of methods for local, cross-project library management.
- Proficient in using Git for version control and updates.

Andi

He worked as a Frontend Engineer at Andi. Andi is a platform for managing environmental and industrial waste collection and recycling campaigns, where I started the project from scratch using Material UI v5, React.js, and Tailwind CSS.

- I created a dashboard and an authentication template that has been used for incoming projects.
- Improved accessibility in the course settings tab, which is a key part of the application.
- Designed restricted views for different user profiles within the application.

Animal ID

I worked as a frontend (Next.js) and mobile (React Native/Expo) developer at Cedula Animal, a platform for managing and tracking pet reminders, both as an app and a website, as well as providing services to help find and recover lost pets. The biggest challenge I faced on this project was working in a new environment as a React Native developer.

- A mobile-centric design approach was applied to maintain consistency between the mobile app and the website.
- I developed a mobile application that was successfully deployed on iOS and Android.
- It uses a REST API for communication and local storage in case of connection loss.
- TypeScript was used for the project's structure and logic.

SKILLS AND TOOLS

Proactive, Curious

React js, React native, Expo, Angular, Html, Javascript, TypeScript, css, Sass, API consumption, Node js, Git

EDUCATION

Universidad Autónoma de Occidente, Cali, Colombia

Licenciatura en Ingeniería - Ingeniería Multimedia
